

Case Study on Ecommerce Application

BY SHREYASI REJA

The following Directory structure is to be followed in the application.

entity/model

Create entity classes in this package. All entity class should not have any business logic.

dao

Create Service Provider interface to showcase functionalities.

Create the implementation class for the above interface with db interaction.

exception

Create user defined exceptions in this package and handle exceptions whenever needed.

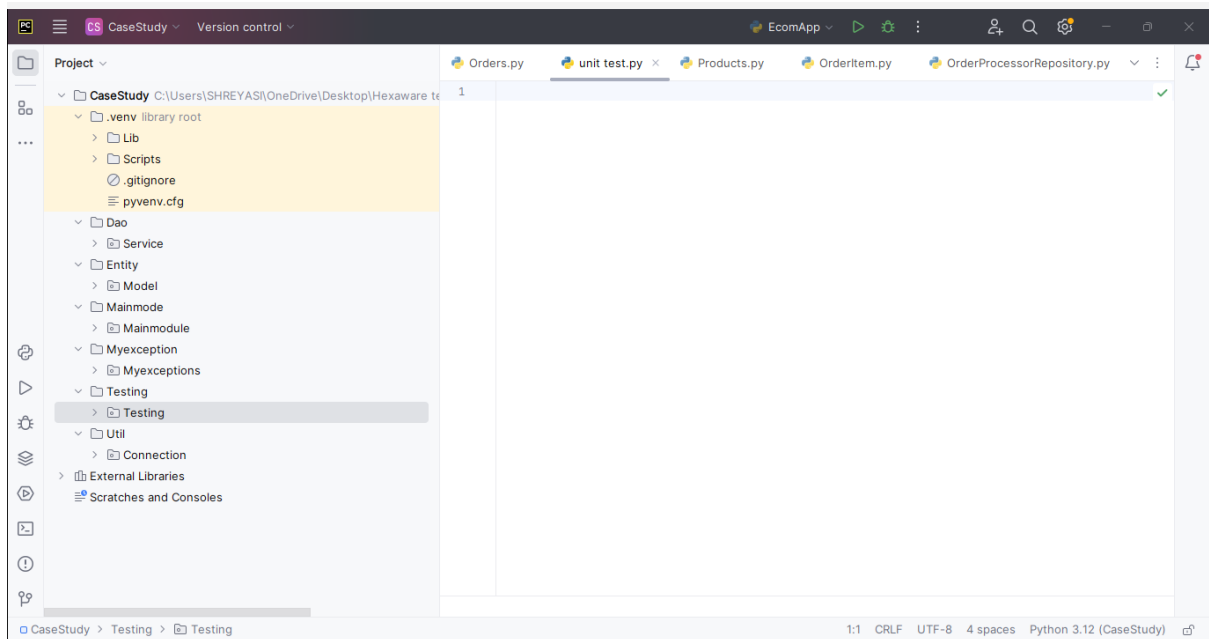

util

Create a DBPropertyUtil class with a static function which takes property file name as parameter and returns connection string.

Create a DBConnUtil class which holds static method which takes connection string as parameter file and returns connection object(Use method defined in DBPropertyUtil class to get the connection String).

main

Create a class MainModule and demonstrate the functionalities in a menu driven application.

Create following tables in SQL Schema with appropriate class and write the unit test case for the Ecommerce application.

Schema Design:

1. customers table:

customer_id (Primary Key)

name

email

password

```
mysql> DESC CUSTOMERS;
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| customer_id | int | NO | PRI | NULL | |
| name | varchar(255) | YES | | NULL | |
| email | varchar(255) | YES | | NULL | |
| password | varchar(255) | YES | | NULL | |
+-----+-----+-----+-----+-----+-----+
4 rows in set (0.06 sec)
```

2. products table:

?

product_id (Primary Key)

name

price

description

stockQuantity

```
mysql> DESC PRODUCTS;
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| product_id | int | NO | PRI | NULL | |
| name | varchar(255) | YES | | NULL | |
| price | decimal(10,2) | YES | | NULL | |
| description | text | YES | | NULL | |
| stockQuantity | int | YES | | NULL | |
+-----+-----+-----+-----+-----+-----+
5 rows in set (0.00 sec)
```

3. cart table:

cart_id (Primary Key)

customer_id (Foreign Key)

product_id (Foreign Key)

quantity

```
mysql> DESC CART;
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| cart_id | int | NO | PRI | NULL | |
| customer_id | int | YES | MUL | NULL | |
| product_id | int | YES | MUL | NULL | |
| quantity | int | YES | | NULL | |
+-----+-----+-----+-----+-----+-----+
4 rows in set (0.00 sec)
```

4. orders table:

order_id (Primary Key)

customer_id (Foreign Key)

order_date

total_price

shipping_address

```
mysql> DESC ORDERS;
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| order_id | int | NO | PRI | NULL | |
| customer_id | int | YES | MUL | NULL | |
| order_date | date | YES | | NULL | |
| total_price | decimal(10,2) | YES | | NULL | |
| shipping_address | varchar(255) | YES | | NULL | |
+-----+-----+-----+-----+-----+-----+
5 rows in set (0.00 sec)

mysql>
```

5. order_items table (to store order details):

?

order_item_id (Primary Key)

order_id (Foreign Key)

product_id (Foreign Key)

quantity

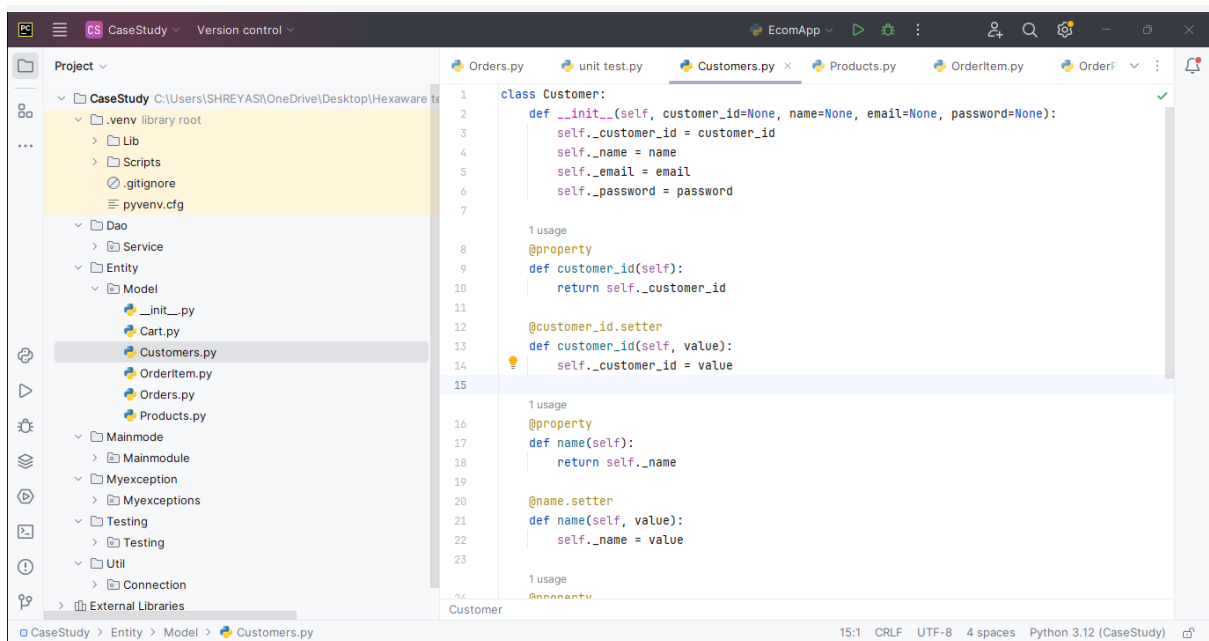

```
mysql> DESC ORDER_ITEMS;
```

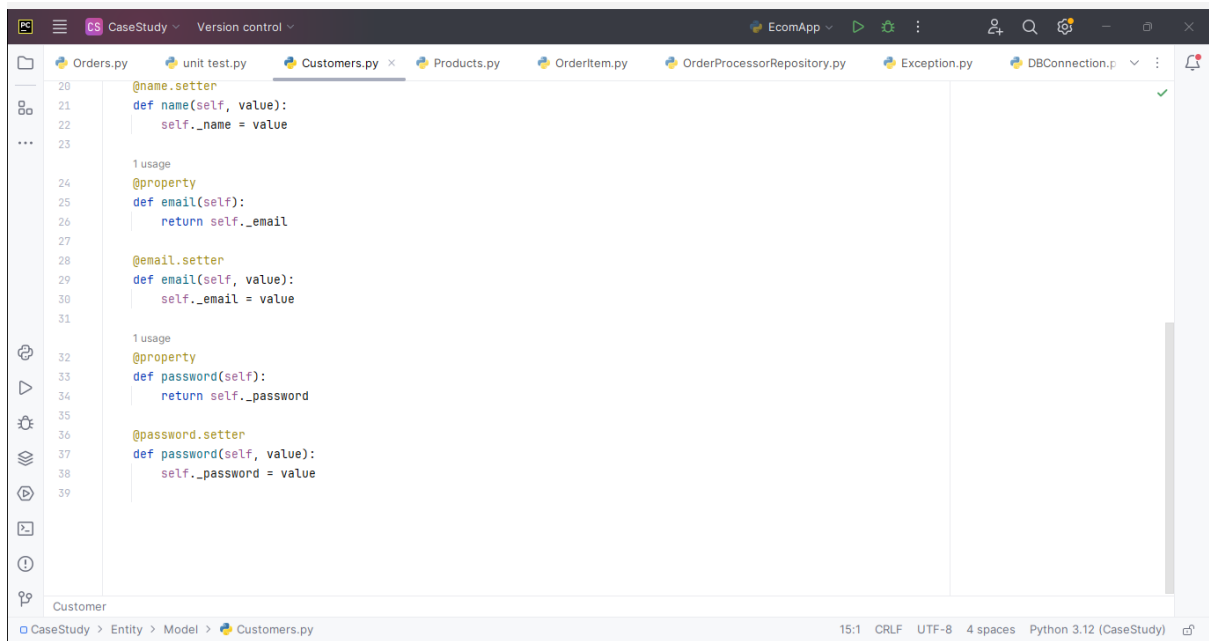

Field	Type	Null	Key	Default	Extra
order_item_id	int	NO	PRI	NULL	
order_id	int	YES	MUL	NULL	
product_id	int	YES	MUL	NULL	
quantity	int	YES		NULL	

4 rows in set (0.00 sec)

Create the model/entity classes corresponding to the schema within package entity with variables declared private, constructors(default and parametrized) and getters, setters)

Customer:-

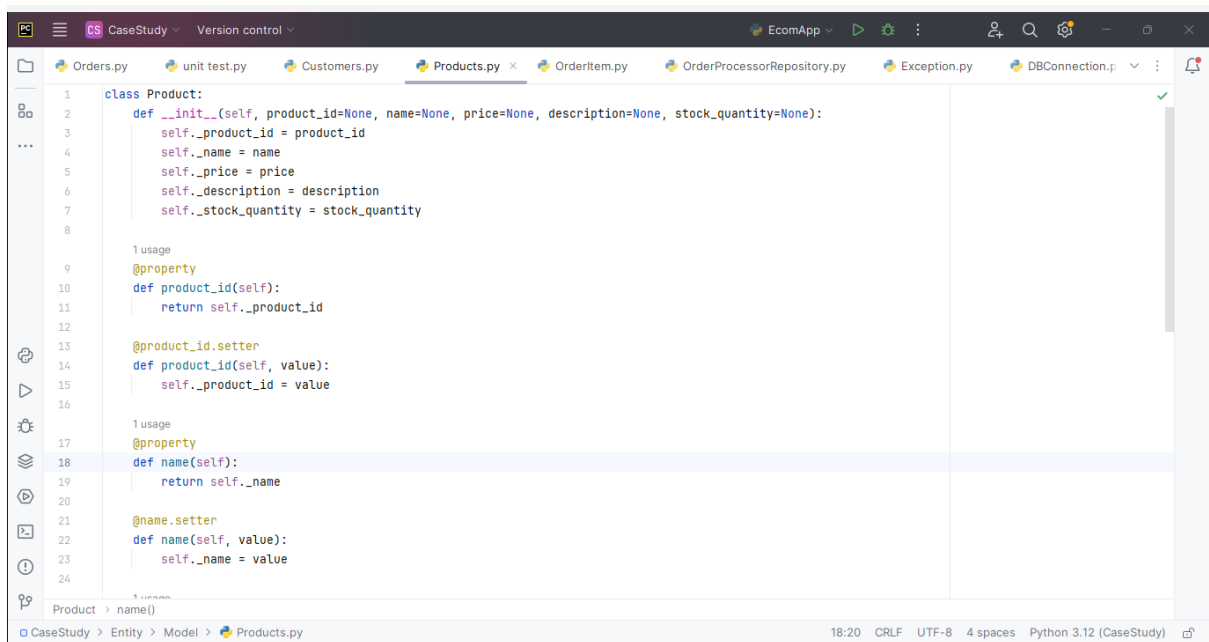

```
20 @name.setter
21 def name(self, value):
22     self.__name = value
23
24 1 usage
25 @property
26 def email(self):
27     return self.__email
28
29 @email.setter
30 def email(self, value):
31     self.__email = value
32
33 1 usage
34 @property
35 def password(self):
36     return self.__password
37
38 @password.setter
39 def password(self, value):
40     self.__password = value
```

Customer

CaseStudy > Entity > Model > Customers.py

15:1 CRLF UTF-8 4 spaces Python 3.12 (CaseStudy)

Product:-

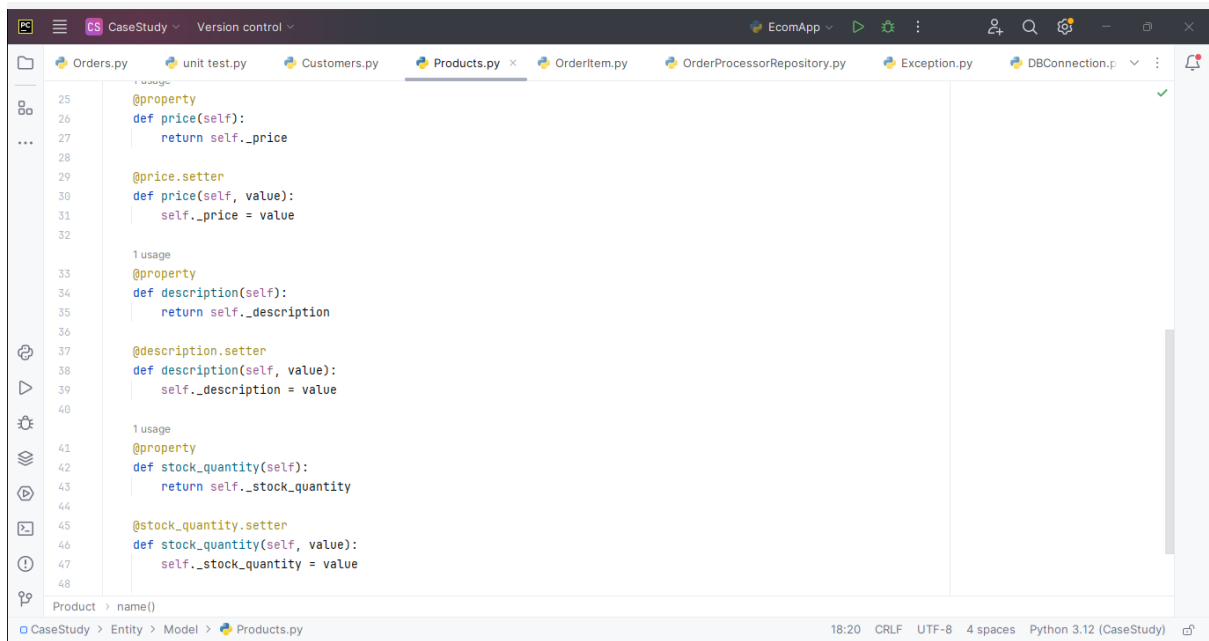

```
1 class Product:
2     def __init__(self, product_id=None, name=None, price=None, description=None, stock_quantity=None):
3         self.__product_id = product_id
4         self.__name = name
5         self.__price = price
6         self.__description = description
7         self.__stock_quantity = stock_quantity
8
9 1 usage
10 @property
11 def product_id(self):
12     return self.__product_id
13
14 @product_id.setter
15 def product_id(self, value):
16     self.__product_id = value
17
18 1 usage
19 @property
20 def name(self):
21     return self.__name
22
23 @name.setter
24 def name(self, value):
25     self.__name = value
```

Product > name()

CaseStudy > Entity > Model > Products.py

18:20 CRLF UTF-8 4 spaces Python 3.12 (CaseStudy)

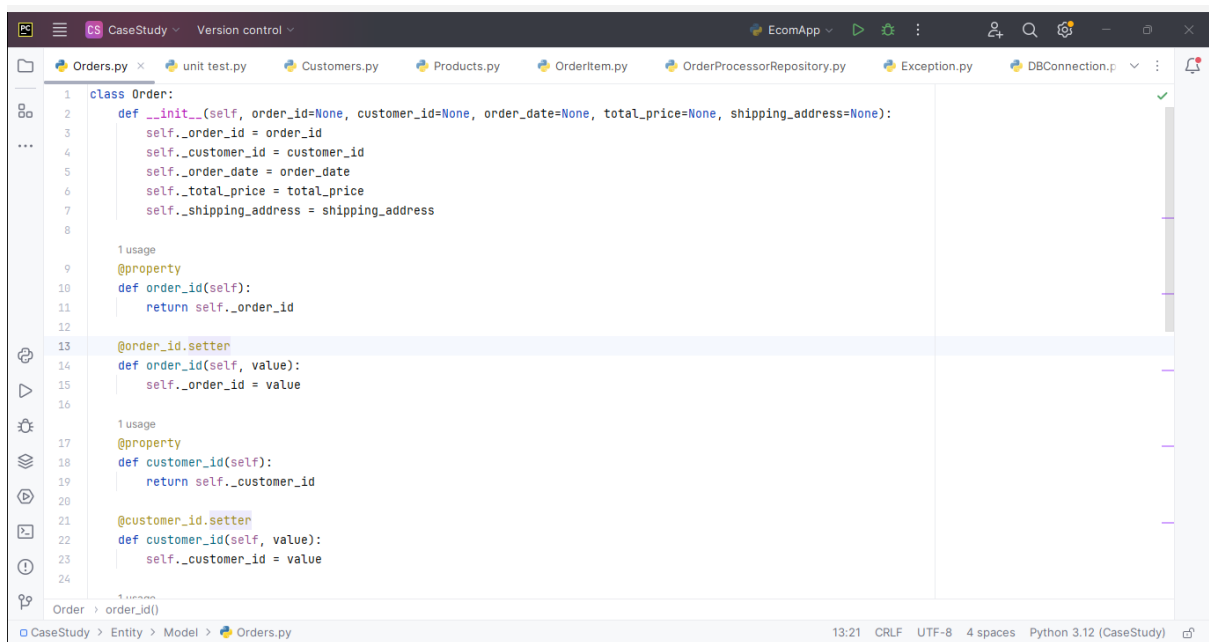

```
25 @property
26 def price(self):
27     return self._price
28
29 @price.setter
30 def price(self, value):

31     self._product_id = value
32
33 1 usage
34 @property
35 def quantity(self):
36     return self._quantity
37
38 @quantity.setter
39 def quantity(self, value):
40     self._quantity = value
```

6. Service Provider Interface/Abstract class:

Keep the interfaces and implementation classes in package dao

Define an OrderProcessorRepository interface/abstract class with methods for adding/removing products to/from the cart and placing orders. The following methods will interact with database.

1. createProduct()

parameter: Product product

return type: Boolean

2. createCustomer()

parameter: Customer customer

return type: boolean

3. deleteProduct()

parameter: productId

return type: boolean

4. deleteCustomer(customerId)

parameter: customerId

return type: boolean

5. addToCart(): insert the product in cart.

parameter: Customer customer, Product product, int quantity

return type: boolean

6. removeFromCart(): delete the product in cart.

parameter: Customer customer, Product product

return type: boolean

7. getAllFromCart(Customer customer): list the product in cart for a customer.

parameter: Customer customer

return type: list of product

8. placeOrder(Customer customer, List<Map<Product,quantity>>, string shippingAddress): should update order table and orderItems table.

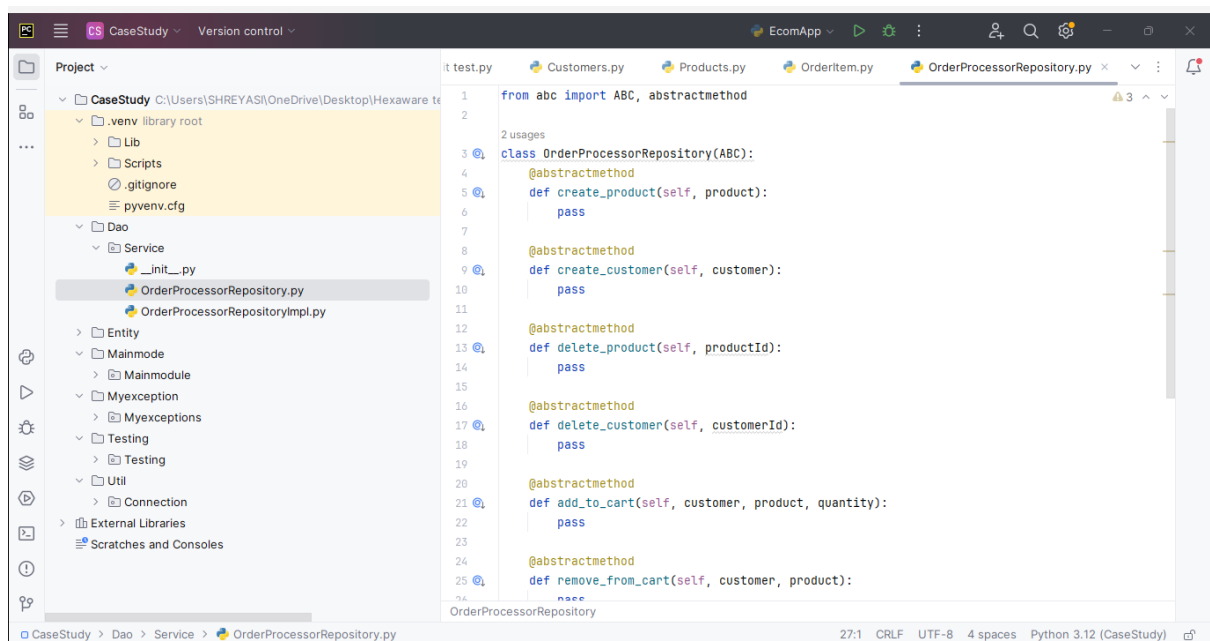

1. parameter: Customer customer, list of product and quantity

2. return type: boolean

9. getOrdersByCustomer()

1. parameter: customerId

2. return type: list of product and quantity

```
18 pass
19
20 @abstractmethod
21 def add_to_cart(self, customer, product, quantity):
22     pass
23
24 @abstractmethod
25 def remove_from_cart(self, customer, product):
26     pass
27
28 @abstractmethod
29 def get_all_from_cart(self, customer):
30     pass
31
32 @abstractmethod
33 def place_order(self, customer, products_quantity, shipping_address):
34     pass
35
36 @abstractmethod
37 def get_orders_by_customer(self, customer_id):
38     pass
39
```

7. Implement the above interface in a class called OrderProcessorRepositoryImpl in package dao.

```
1 from Dao.Service.OrderProcessorRepository import OrderProcessorRepository
2 from Myexception.Myexceptions.Exception import CustomerNotFoundException, ProductNotFoundException
3
4 2 usages
5 class OrderProcessorRepositoryImpl(OrderProcessorRepository):
6     def __init__(self):
7         self.db_util = {}
8         self.customers_database = {}
9         self.products_database = {}
10        self.cart_database = {}
11        self.orders_database = {}
12        self.order_items_database = {}
13
14    def create_product(self, product):
15        product_id = len(self.products_database) + 1
16        self.products_database[product_id] = product
17        return product_id
18
19    def create_customer(self, customer):
20        customer_id = len(self.customers_database) + 1
21        self.customers_database[customer_id] = customer
22        return customer_id
23
24    def delete_product(self, product_id):
25        if product_id not in self.products_database:
26            raise ProductNotFoundException("Product not found in the database.")
27        del self.products_database[product_id]
28
29    def remove_from_cart(self):
```

```
28 def delete_customer(self, customer_id):
29     if customer_id not in self.customers_database:
30         raise CustomerNotFoundException("Customer not found in the database.")
31     del self.customers_database[customer_id]
32
33 def add_to_cart(self, customer, product, quantity):
34     if product.productId not in self.products_database:
35         raise ProductNotFoundException("Product not found in the database.")
36
37     if customer.customerId not in self.cart_database:
38         self.cart_database[customer.customerId] = {}
39
40     if product.productId in self.cart_database[customer.customerId]:
41         self.cart_database[customer.customerId][product.productId] += quantity
42     else:
43         self.cart_database[customer.customerId][product.productId] = quantity
44
45 def remove_from_cart(self, customer, product):
46     if customer.customerId not in self.cart_database or product.productId not in self.cart_database[
47         customer.customerId]:
48         raise ProductNotFoundException("Product not found in the cart.")
49
50     del self.cart_database[customer.customerId][product.productId]
51
52 def get_all_from_cart(self, customer):
53     return self.cart_database.get(customer.customerId, {})
```

OrderProcessorRepositoryImpl -> remove_from_cart()

CaseStudy > Dao > Service > OrderProcessorRepositoryImpl.py 50:71 CRLF UTF-8 4 spaces Python 3.12 (CaseStudy)

```
43 self.cart_database[customer.customerId][product.productId] = quantity
44
45 def remove_from_cart(self, customer, product):
46     if customer.customerId not in self.cart_database or product.productId not in self.cart_database[
47         customer.customerId]:
48         raise ProductNotFoundException("Product not found in the cart.")
49
50     del self.cart_database[customer.customerId][product.productId]
51
52 def get_all_from_cart(self, customer):
53     return self.cart_database.get(customer.customerId, {})
54
55 def place_order(self, customer, products_quantities):
56     order_id = len(self.orders_database) + 1
57     self.orders_database[order_id] = {'customer_id': customer.customerId,
58                                     'products_quantities': products_quantities}
59     return order_id
60
61 def get_orders_by_customer(self, customer_id):
62     user_orders = [order for order in self.orders_database.values() if order['customer_id'] == customer_id]
63     return user_orders
64
```

OrderProcessorRepositoryImpl -> remove_from_cart()

CaseStudy > Dao > Service > OrderProcessorRepositoryImpl.py 50:71 CRLF UTF-8 4 spaces Python 3.12 (CaseStudy)

Connect your application to the SQL database:

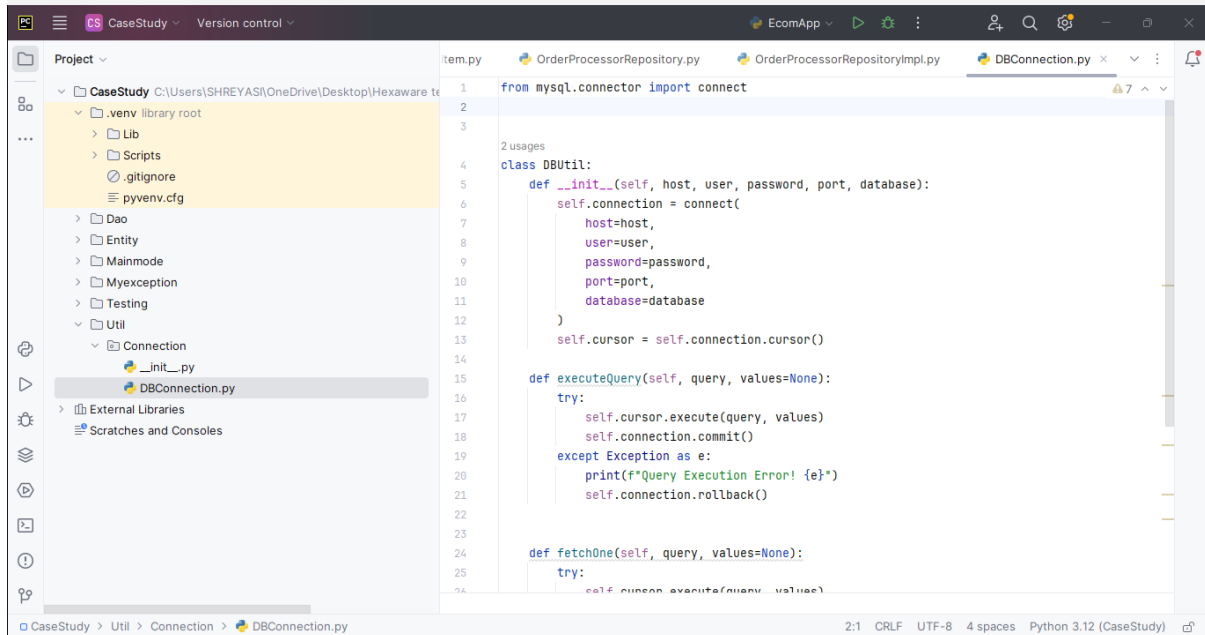

8. Write code to establish a connection to your SQL database.

Create a utility class DBConnection in a package util with a static variable connection of Type Connection and a static method getConnection() which returns connection.

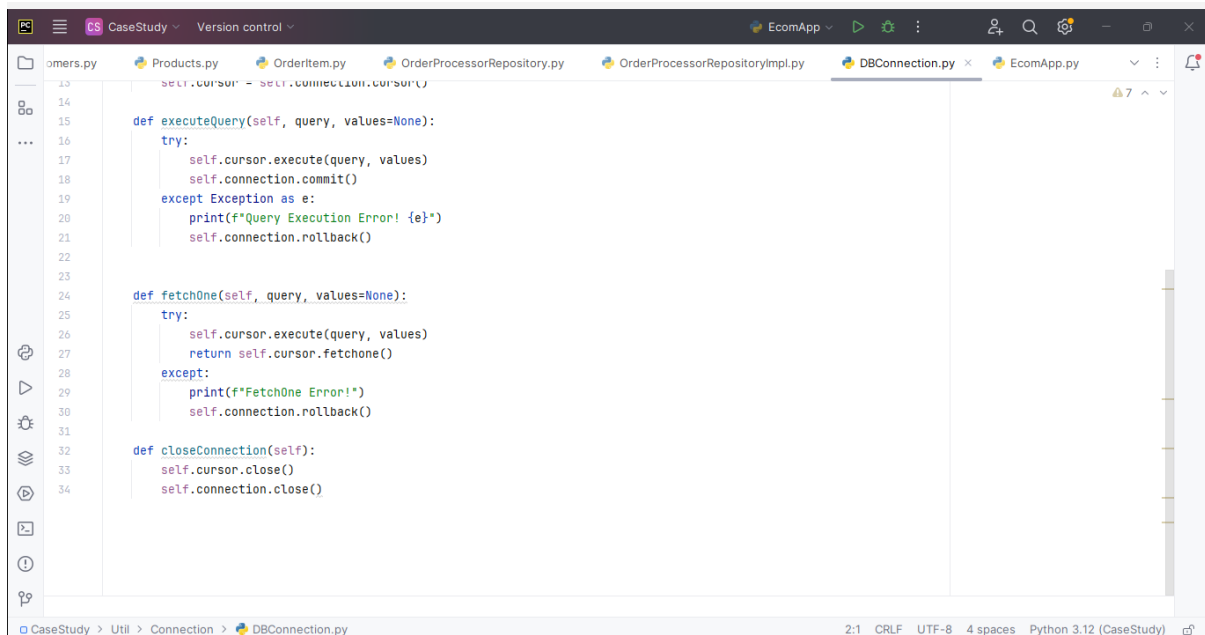

Connection properties supplied in the connection string should be read from a property file.

Create a utility class PropertyUtil which contains a static method named getPropertyString() which reads a property file containing connection details

like hostname, dbname, username, password, port number and returns a connection string.

```
1 from mysql.connector import connect
2
3
4 2 usages
5 class DBUtil:
6     def __init__(self, host, user, password, port, database):
7         self.connection = connect(
8             host=host,
9             user=user,
10            password=password,
11            port=port,
12            database=database
13        )
14        self.cursor = self.connection.cursor()
15
16     def executeQuery(self, query, values=None):
17         try:
18             self.cursor.execute(query, values)
19             self.connection.commit()
20         except Exception as e:
21             print(f"Query Execution Error! {e}")
22             self.connection.rollback()
23
24     def fetchOne(self, query, values=None):
25         try:
26             self.cursor.execute(query, values)
```

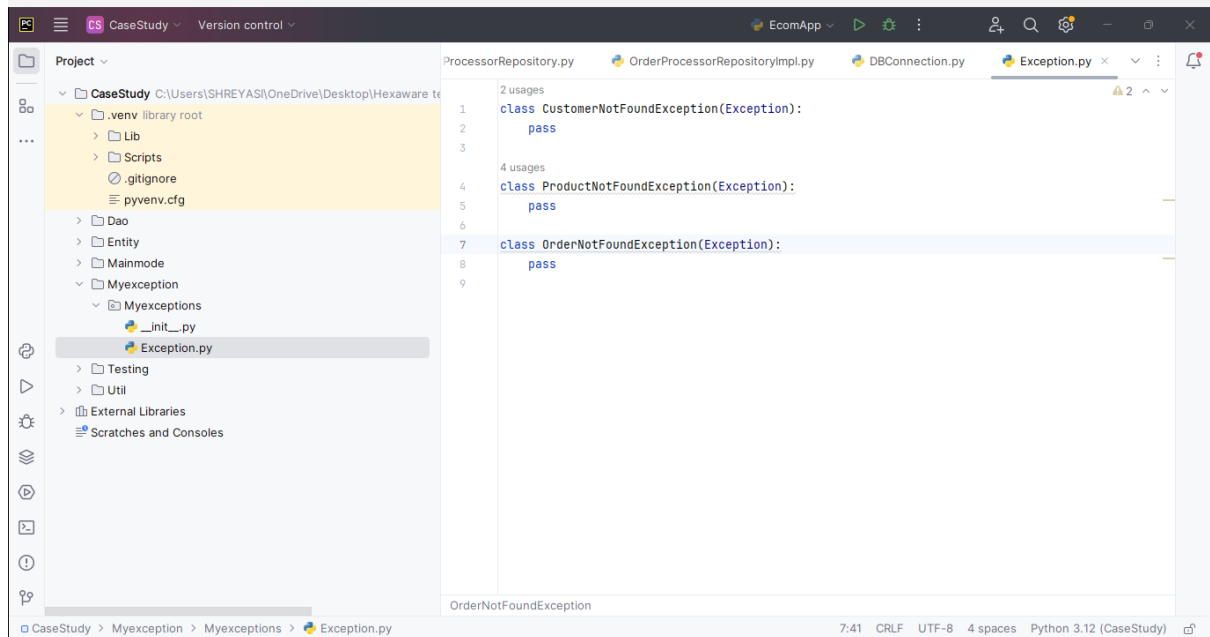

```
13 self.cursor = self.connection.cursor()
14
15
16 def executeQuery(self, query, values=None):
17     try:
18         self.cursor.execute(query, values)
19         self.connection.commit()
20     except Exception as e:
21         print(f"Query Execution Error! {e}")
22         self.connection.rollback()
23
24 def fetchOne(self, query, values=None):
25     try:
26         self.cursor.execute(query, values)
27         return self.cursor.fetchone()
28     except:
29         print(f"FetchOne Error!")
30         self.connection.rollback()
31
32 def closeConnection(self):
33     self.cursor.close()
34     self.connection.close()
```

9. Create the exceptions in package myexceptions and create the following custom exceptions and throw them in methods whenever needed. Handle all the exceptions in main method,

CustomerNotFoundException: throw this exception when user enters an invalid customer id which doesn't exist in db

ProductNotFoundException: throw this exception when user enters an invalid product id which doesn't exist in db

OrderNotFoundException: throw this exception when user enters an invalid order id which doesn't exist in db

10. Create class named EcomApp with main method in app Trigger all the methods in service implementation class by user choose operation from the following menu.

1. Register Customer.
2. Create Product.
3. Delete Product.
4. Add to cart.
5. View cart.
6. Place order.
7. View Customer Order

```
from Dao.Service.OrderProcessorRepositoryImpl import OrderProcessorRepositoryImpl
from Util.Connection.DBConnection import DBUtil

1 usage
class EcomApp:
    def __init__(self):
        self.order_processor = OrderProcessorRepositoryImpl()
        self.db_util = DBUtil(host='localhost', user='root', password='Root', port='3306', da

1 usage
    def register_customer(self):
        try:
            connection = self.db_util.connection
            cursor = connection.cursor()

            customer_id = int(input("Enter customer ID: "))

            name = input("Enter customer name: ")
            email = input("Enter customer email: ")
            password = input("Enter customer password: ")

            query = "INSERT INTO customers (customer_id, name, email, password) VALUES (%s, %s, %s, %s)"
            cursor.execute(query, (customer_id, name, email, password))

            connection.commit()
            cursor.close()
            connection.close()
```

```
cursor.close()
connection.close()

print("Customer registered successfully!")
except Exception as e:
    print(f"Error registering customer: {e}")

1 usage
def create_product(self):
    try:
        connection = self.db_util.connection
        cursor = connection.cursor()

        name = input("Enter product name: ")
        price = float(input("Enter product price: "))
        description = input("Enter product description: ")
        stock_quantity = int(input("Enter product stock quantity: "))

        query = "INSERT INTO products (name, price, description, stock_quantity) VALUES (%s, %s, %s, %s)"
        cursor.execute(query, (name, price, description, stock_quantity))

        connection.commit()
        cursor.close()
        connection.close()

        print("Product created successfully!")
    except Exception as e:
```

The screenshot shows a code editor with the file `EcomApp.py` open. The `delete_product` method is defined, which takes `self` as an argument. It uses a `try` block to establish a database connection, execute a `DELETE` query based on the `product_id` input, and commit the transaction. It includes exception handling for any errors. The status bar at the bottom indicates the file encoding is UTF-8, line endings are CRLF, and it uses 4 spaces for indentation.

```
48         print("Product created successfully!")
49     except Exception as e:
50         print(f"Error creating product: {e}")
51
52     1 usage
53     def delete_product(self):
54         try:
55             connection = self.db_util.connection
56             cursor = connection.cursor()
57
58             product_id = int(input("Enter product ID to delete: "))
59
60             query = "DELETE FROM products WHERE product_id = %s"
61             cursor.execute(query, (product_id,))
62
63             connection.commit()
64             cursor.close()
65             connection.close()
66
67             print("Product deleted successfully!")
68         except Exception as e:
69             print(f"Error deleting product: {e}")
70
71     1 usage
72     def add_to_cart(self):
73         try:
```

EcomApp > place_order() > try
CaseStudy > Mainmode > Mainmodule > EcomApp.py
128:40 CRLF UTF-8 4 spaces Python 3.12 (CaseStudy)

The screenshot shows the same code editor with `EcomApp.py` open, displaying the `add_to_cart` and `view_cart` methods. The `add_to_cart` method prompts for `customer_id`, `product_id`, and `quantity`, then executes an `INSERT` query. The `view_cart` method is partially visible. The status bar remains the same as in the previous screenshot.

```
70     def add_to_cart(self):
71         try:
72             connection = self.db_util.connection
73             cursor = connection.cursor()
74
75             customer_id = int(input("Enter customer ID: "))
76             product_id = int(input("Enter product ID to add to cart: "))
77             quantity = int(input("Enter quantity: "))
78
79             query = "INSERT INTO cart (customer_id, product_id, quantity) VALUES (%s, %s, %s)"
80             cursor.execute(query, (customer_id, product_id, quantity))
81
82             connection.commit()
83             cursor.close()
84             connection.close()

Unit Testing

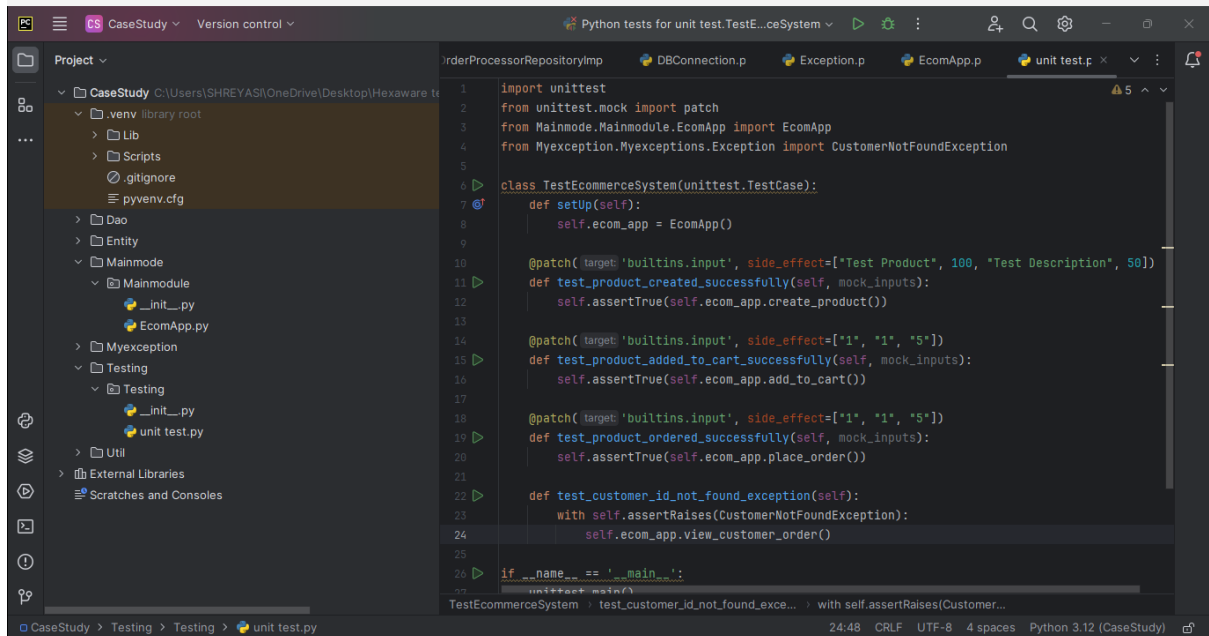

11. Create Unit test cases for Ecommerce System are essential to ensure the correctness and reliability of your system. Following questions to guide the creation of Unit test cases:

Write test case to test Product created successfully or not.

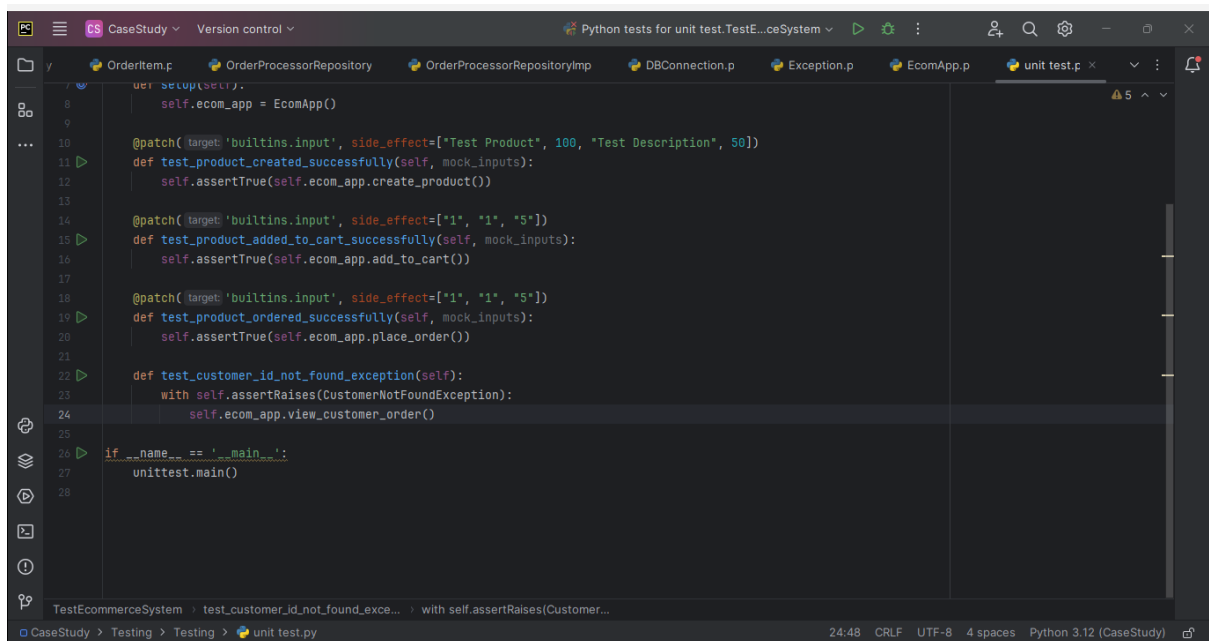

Write test case to test product is added to cart successfully or not.

Write test case to test product is ordered successfully or not.

write test case to test exception is thrown correctly or not when customer id or product id not found in database.

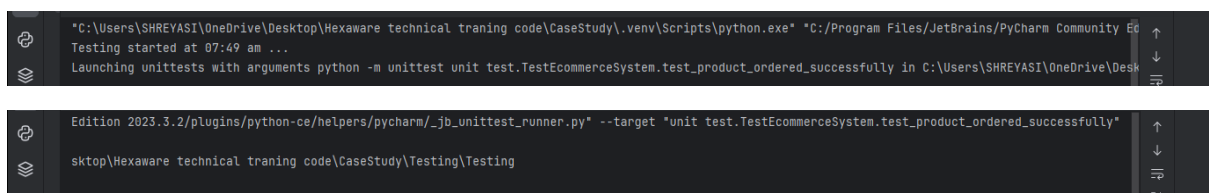

```
